Plan:

SETUP:
Open up local host

STEPS:
Press the start button,
Select boxes and watch how O plays,
Interpret how the outcome statement is made

Bugs:

The tic tac toe has a spot where the O that is printed is a lowercase O.

The computer does the same thing every time, starting with the top left box, working to the right, then moving to the next row.

If you put an X in the middle left box it can be overwritten by the lowercase O.

The O's will only take 3 turns max. It will only place in the top row and the box in the middle on the left

If you get three in a row, you will lose.

If O gets three in a row it will lose.

Deployment:

To deploy, you make sure you have your base code written out or whatever code you want to use initially. You can go through platforms like Heroku that will automatically deploy for you, or you can do it manually. Heroku will take your files that you have saved through GitHub and will present it on a domain for testing, or you can rent a domain and permanently set your webpage/server up. When you make adjustments to your code and push the changes to GitHub, Heroku will watch for those changes and will automatically update your page for you allowing for a simple process.
